

RESTORE Act Projects Floridatown Water Quality Enhancement

Project Description

This project will construct a hydrodynamic separator or equivalent best management practice at an existing drainage outfall near Floridatown Park. The separator will intercept untreated stormwater to remove trash, debris, sediment, and hydrocarbons prior to entering Escambia Bay. The lack of such treatment has put tremendous pressure on natural resources in the bay due to fast-paced population growth in the area. This project will contribute to overall water quality improvements in the area.
